It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1963: contig of 1963 bp in length

NOTE: This is a 'working draft' sequence. It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 15 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as "runs of N, but the exact sizes of the gaps are unknown." This record will be updated with the finished sequence as second as it is available and the accession number will be preserved.

Rat Genome Sequencing Consortium.

Direct Submission

AL Submission

AL Submitted (19-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On May 9, 2003 this sequence version replaced gi:24817791.

The sequence in this assembly is a combination of BAC based reads and whole genome shortun sequencing reads assembled using Atlas (Ihttp://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shortun sequence reads. Both end sequences and whole genome shortun sequence reads. Both end sequences and whole genome shortun sequence reads. Both end sequences and whole genome shortun sequence reads. Both end sequences and whole genome shortun sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NOTE: Setimated insert size may differ from sequence length (see http://www.hgsc.bom.tmc.edu/docs/Genbank draft data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AC131337 345420 bp DNA linear HTG 23-APR-2003

WGS-discovery: Paired-end low-coverage whole genome shotgun reads
were generated from 12921/5vium, C3H/Hebr, and BAIRG-CBW. The WGS
were generated from 12921/5vium, C3H/Hebr, and BAIRG-CBW. The WGS
were generated from 12921/5vium, C3H/Hebr, and BAIRG-CBW. The WGS
were generated from the SSSI/Svium, C3HL/GJ assembly and SNP
detection was carried out by SSAHA-SNP. 225,000 reads were
anotated an STSS and 81,000 SNPs were annotated with alleles from C57BL/GJ
and the strain from which the particular read came. The validation
rate for these SNPs was estimated at approximately 98%.

The patent discloses novel human ion channel polypeptides and their corresponding polymucleotides. The ion channel sequences and their modulators are used for the treatment of viral infections (e.g. human immunodeficiency virus (HVV), thyroid disorders (e.g., thyrotoxicosis, myxoedema), renal failure, inflammatory conditions (e.g., thyrotoxicosis, myxoedema), renal failure, inflammatory conditions (e.g., thyrotoxicosis, psychotic and neurological disorders (e.g. auxiety, depression and schizophrenia), dyskinesias (e.g. Huntington's disease), degenerative disorders (e.g., Parkinson's disease, Alzheimer's disease), cardiovascular diseases, cancer, metabolic disorders (e.g. anorexia, obesity) and mental disorders. The present sequence is a cDNA encoding human ion channel-91 (ion91) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; ion channel; immune response; RFLP; genetic mapping; restriction fragment length polymorphism; viral infection; inflammatory condition; Crohn's disease; homestaals; cancer; rheumatoid archritis; autoimmune disorder; CMS disorder; decential nervous system disorder; Huntington's disease; virucide; degenerative disorder; Parkinson's disease; Alzheimer's disease; cardiovascular disease; myocardial infarction; hormonal disorder; irranscription factor; antiinflammatory; antirheumatic; antiarthritic; immunosuppressive; nootropic; anticonvulsant; antiparkinsonian;

The present invention relates to the isolation of novel human ion channel polypeptides, and the polynucleotide sequences encoding them. The human ion channel polypeptides are useful for inducing an immune response in a mammal, and for identifying a compound which binds to and/or modulates the on channel. The polynucleotide sequences encoding human ion channel polypeptides are useful for screening restriction fragment length polynucleotides are useful in the blanch of diseases or conditions and to genetic mapping. The human ion channel polypeptide and polynucleotide sequences or useful in the treatment of diseases or conditions such as viral infections, inflammatory conditions (e.g. Crohn's disease), diseases central nervous system (NNS) disorders (e.g. dementia, Huntington's disease), degenerative disorders (e.g. mycandial infarction), cancer, and hormonal disorders. The polynucleotide sequences are useful to design novel transcription factors for modulating the expression of human ion them. The present sequence represents a cDNA clone encoding a human ion channel polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nootropic; neuroprotective; neuroleptic; immunosuppressive; cardiant; antiarteriosclerotic; antiinflammatory; antidepressant; antiarthritic; opthalmological; cytostatic; hypertensive; hypotensive; vasotropic; antidiyraine; analgesic; antiparkinsonian; thrombolytic; antithyroid; ion channel; ion-x; brain disorder; mental disorder; schizophrenia; depression; anxiety; attention deficit hyperactivity disorder; migraine; stroke; neurodegenerative disease; Alzheimer's disease; parkinson's disease; glaucoma; macular degeneration; earliorascular disease; ischeemia; cogeneration; high blood pressure; restenosis; thyroid disorder; renal failure; inflammatory condition; autoimmune disorder; rheumatoid arthritis; movement disorder; cardiovascular disorder; thrombosis; athersclerosis; proliferative disorder; cardiovascular disorder; hormonal disorder; sexual dysfunction;
                                                             Novel human ion channel polypeptide, useful for inducing an immune response in a mammal and for treating disease or conditions related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

```
The invention describes an isolated nucleic acid comprising a sequence encoding at least a portion of an ion channel (ion-x). The invention is useful to detect and treat diseases and conditions of the brain, particularly mental diseases and conditions of the brain, anxiety, attention deficit hyperactivity disorder, migraine, stroke, and neurodegenerative diseases such as Alzheimer's disease, Parkinson's disease, glaucoma and macular degeneration, cardiovascular diseases such as ischaemia, congestive heart failure, arrythmia, high blood pressure and sectenosis. The invention may also be used to detect or treat thyroid disorders, renal failure, inflammatory conditions, autoimmune disorders including zheumatoid arthritis, movement disorders, central nervous system disorders, infections, eating disorders, cardiovascular disorders including thrombosis and athersclerosis, and proliferative disorders such as cancers, hormonal disorders and sexual dysfunction. This sequence encodes a novel ion channel.
                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid sequences encoding ion channels are useful to detect and treat human diseases and conditions, particularly of the brain, especially mental disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 15; DB 9; Length 657;

                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method (MI) for identifying genes involved in plant resistance or response to pathogenic infection. MI comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                            9 9
                                                                                                                                                                                                                    Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, appoiosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, interferons, interleukins, Gropoteins cytochromes, xinesins, cytokines, interferons, interleukins, Gropoteins cytochromes, xinesins, cytokines, interferons, interleukins, Gropoteins cytochromes, xinesins, cytokines, interferons, interleukins, Gropoteins cytochromes and thie peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes.

Systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukamai), diseases of the nervous system and an infection of pathogenic
                                                                                            Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition for therapy and diagnosis of ovarian cancer comprising polypeptide of a ovarian tumor polypeptide, polynucleotide encoding polypeptide, antibody specific to polypeptide or T cell expressing polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ovarian cancer; ovarian tumour; cytostatic; gene; ss.

The present invention describes a composition (I) comprising: carriers and almanostimulants, and a polypeptide (III) of a ovarian tumour polypeptide encoded by a polymucleotide (III) having a companient of Erom the 10912 nucleotide sequence (S2), a Teall population of (II), cor antigen presenting (II) having a sequence (S2), a Teall population of (II), cor antigen presenting cells that express (II). (I) has cycostatic activity. An oligomucleotide (IV) that bybridises to (S1) can be used for detecting ovarian cancer in a patient's biological sample preferably cample from a patient with (IV), detecting the amount of polynucleotide hybridising to (IV) and comprises contacting a biological cample from an exaction (FR). (I) comprising (III) and/or an expect the amount of polynucleotide hybridising to (IV) is detected preferably by calle and thereby detecting ovarian cancer in the patient, where the amount of polynucleotide hybridising to (IV) is detected preferably by useful for stimulating and/or expanding T cells specific for an ovarian tumour protein comprising contacting T cells with (III) or (III) is useful in design and preparation of ribozyme and protesins in tumour cells; and consequence a full length gene from a suitable library e.g., a tumour cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human interleukin 3 deriv. and its prepn. - for supplementing bone marrow transplantation and increasing platelet count.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence codes for a derivative of human IL-3 having amino acids Arg, Leu, Leu and His at positions 64, 83, 88 and 99, respectively, subscituted by Lys, Pro, Met and Arg. The derivative has a higher activity than native IL-3. See AAR22813-4, AAQ22503-Q22510 and AAQ22513

The 5' end of this strand overhangs the 3'end of the complementary strand by 4 bases; the 5' end of the complementary strand overhangs this strand by the terranuclatide sequence 5'-AATT-3'. The insert is used in the construction of plasmid pGGS8, which is in turn used in the construction of plasmids coding for human IL-3 derivs. See AAR22813-4, AAQ22503-Q22510
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence codes for a derivative of human IL-3 having amino acids Arg, Leu and Leu at positions 64, 83 and 88, respectively, substituted by Lys, Pro and Met. The derivative has a higher activity than native IL-3. See AAR22813-4, AAQ22503-Q22510 and AAQ22513
                                                                                                                                                                Human interleukin 3 deriv. and its prepn. - for supplementing bone marrow transplantation and increasing platelet count.

Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for infertifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide for denerating antibodies phoses, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antibodies specific for it. The present sequence is useful for generating antibodies specific for it. The present sequence is one of the 38043 isolated CDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at

The invention relates to an isolated polymucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was ceteranized by the technique of SBH (sequencing by hybridisation). Also included is a purified polymeptide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The nucleic acid sequences of are useful in diagnostics as expressed sequence tags (EST) for ceresponding to information of the novel polymucleotide. The nucleic acid sequences of corporation of the physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations of cereponsible for generic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of correcting antibodies specific for it. The present sequence is useful for generating antibodies specific for it. The present sequence is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at

This cDNA clone includes a coding region for gibbon interleukin-3 (IL3, see AAW68546). IL3 selectively binds to receptors on the surface of haematopoettic progenitor cells (HPC) and is transported into the cells by endocytosis. The invention provides conjugates, including fusion proteins, comprising human Fanconi anaemia complementation group C (FAC) protein (see AAW68546) and a targetting molecule such as gibbon IL3. These conjugates can be expressed e.g. in E. coli host cells utilising vectors encoding His-tagged IL3-FAC (termed His-ILFAC) fusions. The conjugate, or a mucleic acid encoding it, can be used to deliver FAC to an HPC, specifically to inhibit apoptosis, particularly in partients are exposed to high doses of chemotherapy for treatment of non-myeloid cancers, also to treat Fanconi anaemia (by complementation of the genetic defect). Treatment of HPC is done in vitro, ex vivo (e.g. for recombinant production of conjugate in cell cultures) or in vivo. Treatment with FAC may eliminate the need for extensive bone marrow transplants to restore

AAN92339;

ö Non-coding portions may have a regulatory role in transcription in the natural host. The 3'-end contains an AT-rich segment including several repeats of the sequence ATTA, which is believed to be related to the RNA message stability. DNA sequence was used as a probe to obtain a 674EP DNA sequence from a human genomic library (AAN80503). (Updated on 25-MAR-2003 to correct PR field.) Primate IL-3 haematopoietic growth factors - used for treating disease states due to immune cell or haematopoietic cell deficiency. ```
It is the nucleic acid sequence for maize locus 288. The tags indicate the location of primer sequences used in a rapid method of RFLP analysis. In the method each primer is labelled with a fluorescing molecule (chromophore) and hybridised with a restricted target DNA sample in the presence of an oligodeoxyribomucleotide elongating enzyme. Hybridisation is determined by reviewing the gels with a laser and appropriate detector no southern blotting is necessary. Tags A - B = primers 2388.

238A/238A3, 238AOLI, 238COLI and 238CI respectively. (Updated on 25-MAR-2003 to correct PR field.)
                                   Rapid RFLP analysis; chromophore; fluorescing molecule; maize loci 288; primers 238B, 238A/238AR, 238AOL1, 238COL1 and 238C1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Rapid restriction fragment polymorphism analysis, esp. in plant study using a primer labelled with a fluorescing molecule and an elongating enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 909 BP; 196 A; 233 C; 244 G; 236 T; 0 U; 0 Other;

Pred. Mo. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vector: pTriplEx2; Laccaria bicolor Maire Orton; CDNA library from mycelium of Laccaria bicolor Maire Orton; CDNA library from mycelium of Laccaria bicolor grown for ten weeks on agar-plates containing low sugar (1 g/1 glucose) Pachlewski medium. The cDNA library was constructed from mRNA which was isolated from 13ug of total Dnase digested RNA using the SMART CDNA synthesis kit (Clontech, Palo Alto, CA, USA) according to the manufacturer's instructions. The resulting cDNA was packed into lambda phages using the Gigapack III Gold packaging kit (Stratagene, ia Jolla, CA). The pTriplEx2 phagemid clones in Escherichia choli were obtained by using the mass in vivo excision protocol according to the manufacturer's instructions (Clontech)."

/note="Grgan: immature ears: Site_1: Xba I; Site_2: Xba I;
The vector was digested with XbaI and one nucleotide was added by fill in in the recessive 3: end. The genomic DNA was nebulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0:8 and 3 kb and were cloned into the vector (.x/y reads in MH3mpl9, .b/g reads in pUC19). The same ligation was transformed in either UM107 or DH5a. "

/note="Organ: immature ears; Site_1: Xba I; Site_2: Xba I;
The vector was digested with XbaI and one nucleotide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (x/y reads in M13mp19, .b/g reads in pUC19). The same ligation was transformed in either JM107 or DH5a."
                                                                                                                                                                                                                                     ö

/lone="Organ: immature ears: Site_1: XDa I; Site_2: XDa I;
The vector was digested with XbaI and one nucleoTide was added by fill in in the recessive 3; end. The genomic DNA was nabulized, end repaired, adaptor ligated and size fractionated using sephadex. The resulting fragments were between 0:8 and 3 kb and ware cloned into the vector (.X/y reads in Milmpl9. b/g reads in pUC19). The same ligation was transformed in either JM107 or DH5a. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             667 bp DNA linear GSS 26-NOV-2002

re vector was digested with XbaI and one nucleotide was
added by fill in in the recessive 3' end. The genomic DNA
was nebulized, end repaired, adaptor ligated and size
fractionated using sephadex. The resulting fragments were
between 0.8 and 3 kb and were cloned into the vector
(.x/y reads in M13mpl9, .b/g reads in pUC19). The same
ligation was transformed in either JM107 or DH5a.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                id76f05.bl WGS-ZmaysF (JM107 adapted methyl filtered) Zea mays genomic clone id76f05 5', genomic survey sequence.

/lab host="Organ: immature ears; Site 1: Xba I; Site 2: Xba I;
The vector was digested with XbaI and one nucleoFide was
added by fill in in the recessive 3: end. The genomic DNA
was nebulized, end repaired, adaptor ligated and size
fractionated using sephadex. The resulting fragments were
fractionated using sephadex. The resulting fragments were
between 0.8 and 3 kb and were cloned into the vector (:X/y
reads in M13mpl9, .b/g reads in pUC19). The same ligation
was transformed into DHSa."

/note="Organ: immature ears; Site_1: Xbs I; Site_2: Xbs I;
The vector was digested with XbsI and one nucleotide was added by fill in in the recessive 3' end. The genomic DNA was nebulized, end repaired, adaptor lighated and size fractionated using sephadex. The resulting fragments were between 0.8 and 3 kb and were cloned into the vector (.x/y)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Bukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta, Spermatophyta, Magnoliophyta, Liliopaida, Poales, Poaceae, PACCAD clade, Panicoideae, Andropogoneae, Zea.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Published Applications NA:*

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/note="Organ: leaf; Vector: RescueMu (engineered from pBlueScription on RescueMu; Group on RescueMu; Grot the web site www.zmdb.iastate.edu and follow the links for 'RescueMu.' Grid I was grown at Berkeley in 2001. DNA was extracted from leaf punches, double digested using BanHI and BglII; and ligated to form circular plasmide. DH10B cells were transformed and then screened on LB plates with ampicillin."

Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent. CpG oligodeoxynucleotide, unmethylated, antigen-presenting cell; immunogenic; cytokine release; natural killer cell; NK cell activation; cell-mediated immune response; T-cell response; humoral response; B-cell response; natibody production; immune response induction; vaccine; allergy, asthma; infection; bacterial; viral; fungal; protozoal; parasitic; tuberculosis; AIDS; autoimmune disease; lupus erythematosus; rheumatoid arthritis; multiple solenosis; solid tumour; cancer; immune deficiency; biological warfare agent; cytostatic; antiarthritic; antimicrobial; antiallergic; protozoacide; tuberculostatic; antiarthritic; antiasthmatic; dermatological; phosphorothioate; ss. Immunogenic CpG oligodeoxynucleotide, SEQ ID NO:82. Verthelyi D; Claim 4; Page 36; 46pp; English. 12-APR-2000; 2000WO-US009839. 99US-0128898P. (first entry) D, Ishii K, (KLIN/) KLINMAN D. (ISHI/) ISHII K. (VERI/) VERTHBLYI D. WPI; 2001-006880/01. WO200061151-A2. 12-APR-1999; 14-FEB-2001 19-OCT-2000. Synthetic. Klinman 

The invention relates to novel immunogenic CpG oligodeoxynucleotides

19-0CT-2000.

COMPATSON THE OLIGORUCLECTIES are at least 10 bases long and comparise one of the generic sequences 5'-NNWT-CpG-WNNA-3' or 5'-R'-CpG-RY - 3'. The central CpG morif is unmethylated, and the Oligonucleotides optionally have phosphorothhoate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery comprising an oligonucleotide of the invention and a targetting agent, and a pharmaceutcal composition comparising the oligonucleotide of the invention and a targetting agent, and a pharmaceutcal composition comprising the oligonucleotides are able to induce either a cell-nediated (T-cell) response or a humoral (B-cell, antibody) response, with oligonucleotides are able to induce a humoral response. It is thought that after a cell-nediated response, and those of the sequence 5'-RNT-CpG-RNNN-3' being able to induce a humoral response. It is though that after administration, the oligonucleotide acts on antigen-presenting cells cadministration of natural killer (RN) cells. A cell-mediated or humoral response and dendritic cells), which then release cytokines, cleading to activation of natural killer (RN) cells. A cell-mediated or humoral response is useful for treating preventing or ameliorating an allergic reaction (preferably asthma), or an infection, where an immunogenic CpG oligonucleotide is administered either alone or of an inmunogenic CpG oligonucleotide is administered either alone or of incontination which may be treated include eczena, allergic conditions, and the infections which may be treated include viral, bacterial, fungal and protozoal infections such as tuberculosis, AIDS, laishmaina and schlatosomination infections which may be treated include viral, bacterial, fungal and protozoal infections such as tuberculosis, AIDS, laishmaina and schlatosomination may also be erythematosus, rheumatoid arthritis and multiple sclerosis), a disease associated with immune system deficiency and symptome real maninger of an autoinmune disorder (e.g., lupus expense is lymphocytes ex vivo, producing activated lymphocytes which are then administered to the host. The present sequence represents an immunogenic CpG oligodeoxynucleotide of the invention

Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent.

Claim 4; Page 30; 46pp; English.

The invention relates to novel immunogenic CpG oligodecxymucleotides (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5.\*NNT-CpG-WANN-3. or 5.\*RY-CpG-RY CPG optionally have phosphorothicate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex. The invention also relates to an oligonucleotide delivery complex. The oligonucleotide of the invention and a targetting agent, and a phasmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotides are able to induce either a cellmediated (T-cell) response or a humoral (B-cell, antibody) response, with colligonucleotides of the sequence 5.\*RNYT-CpG-WANN-3. The cellmediated response, and those of the sequence 5.\*NNYT-CpG-WANN-3. Desing able to induce a humoral response. It is thought that after administration, the oligonucleotide eacts on antigen-presenting cells (e.g., macrophages and dendritic cells), which then release cytchines, leading to activation of natural killer (WN) cells. A cell-mediated or humoral response can then occur by activation of T- or B-cells. The induction of an immune response is useful for treating, preventing or ameliorating an allergic reaction (preferably sathma), or an infection, where an immunogenic CpG oligonucleotide is administered either alone or the allergic conditions which may be treated include viral, the allergic conditions which may be treated include viral, and the infections which may be treated include viral, and a lateral creation (preferably sathma) or an infection of an autoimmune disorder (e.g., lupus conditions, and the infections which may be treated include viral, and in the treatment of an autoimmune disorder (e.g., lupus conditions, and the infections which may be an autoimmune disorder (e.g., lupus conditions, and the infections which may be an autoimmune disorder (e.g., lupus conditions, and the infections will and protocoal infections end and end of the treated

```
ö
immune response is used in antisense therapy and to improve the efficacy of a vaccine. The oligonucleotide is preferably administered to hymphocytes ex vivo, producing activated lymphocytes which are then administered to the host. The present sequence represents an immunogenic CPG oligodeoxynucleotide of the invention

epitopes of Paramyxoviridae F protein, and cytosine followed by guanine linked by phosphate bond-oligodideoxynucleotides.

The invention describes a vaccine comprising one or more epitopes of a Paramyxoviridae F protein, and one or more CpG (cytosine followed by Quanthe linked by phosphate bond)-oligodideoxynucleotides (ODKs). The vaccine is useful for vaccinating a patient especially against viruses of the Paramyxoviridae family e.g. respiratory syncytial virus (RSV), the primary cause of viral bronchiolitis and pneumonia in infants and children, and infectious pulmonary disease in infants. RSV has been particularly implicated in death of infants that are premature, have bronchopulmonary dysplasia, or congenital heart conditions. This sequence represents an oligodideoxynucleotide that can be used in the creation of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of D type CpG oligodeoxynucleotide Dv28, an example of claimed D type oligodeoxynucleotides (see ACG48294) of the invention. Mature dendritic cells are obtained by contacting a dendritic cell are obtained by contacting a dendritic cell precursor, such as a monocyte, with such an oligodeoxynucleotide:

The method is useful for generating mature dendritic cells and enhancing response, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to diseases such as cancer. Mature dendritic cells may also be used to produce activated I lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CpG oligodeoxymucleotide; dendritic cell; tumour; immunotherapy; vaccine; cytostatic; immunostimulant; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Generating mature dendritic cells for tumor immunotherapy or as vaccines for activating the immune system to treat diseases such as cancer, comprises contacting a dendritic cell precursor with a D type oligodeoxynucleotide.
                                                                                 CpG oligodeoxynucleotide DV35 used for dendritic cell maturation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 18; DB 7; Length 20; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a vaccine comprising one or more epitopes of a paramycoviridae P protein, and one or more CpG (cytosine followed by guanine linked by phosphate bond)-ollgodideoxymucleotides (ODNs). The vaccine is useful for vaccinating a patient especially against viruses of the Paramyxoviridae family e.g. respiratory syncytial virus (RRV), the primary cause of viral bronchiolitis and pneumonia in infants and children, and infectious pulmonary disease in infants. RSV has been particularly implicated in death of infants that premeture, have bronchopulmonary dysplasia, or congenital heart conditions. This sequence represents an oligodideoxymucleotide that can be used in the creation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaccine for immunizing patient against respiratory syncytial virus, has epitopes of Paramyxoviridae F protein, and cytosine followed by guanine linked by phosphate bond-oligodideoxynucleotides.

                                                                                                                                                                                                                The present sequence is that of CpG oligodeoxynucleotide DV52 of the invention. A claimed method for generating dendritic cells involves contacting a dendritic cell precursor, especially a monocyte, with a D type oligodeoxynucleotide (see ACC48294) containing a central unmethylated CpG motif. The method is useful for generating mature dendritic cells and enhancing T cell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to prevent future infection or to activate the immune system to treat diseases such as cancer. Mature dendritic cells may also be used to produce activated I lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CpG oligodeoxynucleotide; dendritic cell; tumour; immunotherapy; vaccine; cytostatic; immunostimulant; gene therapy; ss.

The present sequence is that of a D type CpG oligodeoxynucleotide that is an example of claimed D type oligodeoxynucleotides (see ACC48294) of the invention. Mature dendritic cells are obtained by contacting a dendritic cell precursor, such as a monocyte, with such an oligodeoxynucleotide. The method is useful for generating mature dendritic cells and enhancing T cell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to prevent future infections or to activate the immune system to treat diseases such as cancer. Mature dendritic cells may also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cell; tumour; immunotherapy; vaccine;

contacting a dendritic cell precursor, especially a monocyte, with a D type oligodeoxymucleotide (see ACC48294) containing a central unmethylated CpG motif. The method is useful for generating mature dendritic cells and enhancing T cell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to prevent future infection or to activate the immune system to treat diseases such as cancer. Mature dendritic cells may also be used to produce activated T lymphocytes

Cationic liposome composition for delivering oligodeoxynucleotides including a CpG motif in clinical applications, comprises a cationic lipid, a co-lipid, stabilizing agent and an encapsulated oligonucleotide.

Disclosure; Fig 10C; 110pp; English.

The invention relates to sterically stabilised cationic liposomes (SSCL) which comprises a cationic lipid, a co-lipid, stabilishing agent and encapsulating a K type oligodeoxynucleotide (DDN) including a CpG motif. The invention is useful in pharmaceutical composition for impairing interleukin-13 receptor in subject, for stimulating an immune response, which is expression of a cytokine (e.g. interferon gamma), particularly immunotherapeutic response against tumours or stimulating an in vivo or an in vitro immune cell, and for inducing an immune response against an in vitro immune cell, and for inducing an immune response against an infectious agent e.g. virus, bacteria and fungus. It is also useful for delivering oligodeoxynucleotides including a CpG motif in clinical X4XEX8X**8**\$\$\$\$\$\$\$X8X8X8X8X8X8X8X8X8X8X8X8X8X8

The invention relates to sterically stabilised cationic liposomes (SSCL) which comprises a cationic lipid, a co-lipid, stabilising agent and encapsulating a K type oligodeoxynucleotide (OWN) including a CpG motif. The invention is useful in pharmaceutical composition for impairing growth of a solid tumour cell (e.g. human tumour cell) bearing an interleukin-13 receptor in a subject; for stimulating an immune response, which is expression of a cytokine (e.g. interferon gamma), particularly immunocherapeutic response against tumours or stimulating an in vivo or an in vitro immune cell, and for inducing an immune response against an infectious agent e.g. virus, bacteria and fungus. It is also useful for delivering oligodeoxynucleotides including a CpG motif in clinical applications; for treating infectious diseases (e.g. tularemia, malaria,

Cationic liposome composition for delivering oligodeoxynucleotides including a CpG motif in clinical applications, comprises a cationic lipid, a co-lipid, stabilizing agent and an encapsulated oligonucleotide

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

RETURNEY INVENTION: NUCLEIC ACID AND ANINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: NUCLEIC ACID AND ANID ANID THERAPEUTICS

TITLE OF INVENTION: NUMBER: US/09/252,991A

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR PILING DATE: 1999-02-18

PRIOR PILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-02-18

RETURNEY FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

ERNOR FILING SATE: 1998-07-27

LENGTH: 552
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NSCOULT IN TAXABLE AND TO THE ACT OF THE ACT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1690, Application US/09252991A
Sequence 1690, Application US/09252991A
Sequence 1690, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
TITLE OF INVENTION: WICLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS:
TITLE OF INVENTION: AERUGINOSA POR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: AERUGINOSA POR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ABSUGINOSA POR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: 10796.136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 1690
LENGTH: 3591
                                                                                                                               US-09-252-991A-1425/c

Sequence 1425, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;

TITLE OF INVENTION: APPLICATION NUMBER: US 60/074,738

PRIOR REPRENCE: 1099-02-18

PRIOR APPLICATION NUMBER: US 60/074,738

PRIOR PILING DATE: 1999-02-18

PRIOR PILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

LENGTH: 1356
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ç
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

GENERAL INPORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.13 6
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR PILING DATE: 1998-02-18
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR PILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WS-08-861-774E-55
